

KCC

Cross-platform GUI File Manager

About

KCC is GUI file manager, which is a simple analog of Double Commander for Linux-based systems and Total Commander for Windows. Unlike them, KCC is cross-platform and can be used on different operating systems. The file manager is created with Qt - a C++ framework.

How to run

Prerequisites

- Qt 5.11.0 or later
- Libarchive

Installation

- Clone the project from <https://github.com/neverlandjt/kcc.git>

- **Compile the Project:**

```
$ mkdir build && cd build  
$ cmake -G"Unix Makefiles" ..  
$ make
```

- **Run**

```
./kcc
```

Functionality

Copy files and directories

To copy, right click on selected files or directories, then select "Copy" from the context menu.

Cut files and directories

To cut, right click on selected files or directories, then select "Cut" from the context menu.

Paste files and directories

To paste copied files or directories, right click on any of two sides of the program and select "Paste" from the context menu.

If files with such names already exist at the destination path, you can overwrite them or cancel operation.

Move files and directories

To move, right click on selected files or directories, then select "Move" from the context menu and enter a destination path. By default, current path at the other side of the program is a destination path. If files with such names already exist, you can overwrite them or cancel operation.

Delete files and directories

To delete, right click on selected files or directories, then select "Delete" from the context menu.

Rename file or directory

To rename, right click on selected file or directory, then select “Rename” from the context menu and enter a new name.

Create new file or directory

To create new file or directory, on the main menu select File -> Create -> New File or New Directory, then enter a name of created file(New File/New Folder by default). The file/directory is created in the currently active side of the program.

Extract archives

To extract files from archive, right click on selected archive then select “Extract” to extract into the current path or “Extract to” to specify destination path.

Compress files and directories

To compress, right click on selected files and directories, then select “Compress” from the context menu and enter an archive name.
